

# 3 Ways

# we're greening our packaging

RENEWABLE  
RESOURCES

LOW  
CARBON

COMPOSTABLE

## 1

### Where it comes from...

Our packaging comes from annually renewable resources and recycled post consumer waste material.

>> Using 15 cases of bio-plastic cups saves 159 litres of oil.

## 2

### What its made of...

We use packaging made from bio-plastic, sugar bagasse, recycled paper, recycled plastic and sustainable wood.

>> Bio-plastic emits 77% less carbon dioxide per kilo than conventional plastic. So for every kilo of material around 2.65 kilos of carbon dioxide is saved.

## 3

### Where is ends up...

The environmental packaging used here can be disposed of by recycling or industrial composting

>> Conventional plastics take 500 years to degrade, while bio-plastics can break down within 10 weeks in a commercial composting facility.
